

Conditions (If, If-else, nested if)

Def: Conditional statements that let your program make decisions & execute diff code based on conditions.

How to use: `int marks = 75;`

```
if (marks >= 90) {
```

```
    s.o.p("Grade A");
```

```
} else if (marks >= 75) {
```

```
    s.o.p("Grade B");
```

```
} else {
```

```
    s.o.p("Grade C");
```

```
}
```

ASHOKA

Date: / /

when to use: whenever your program needs to behave d/f depending on a condition (pass/fail, eligible/not eligible).

where to use: validations, decision logic, menu selections - extremely common, used constantly.

why nested if, not just multiple separate ifs: Nested if lets you check a condition only after another condition is already true - useful when conditions depend on each other (e.g., check if a no. is positive, THEN check if it's even).

Real-life ex: Like a traffic signal decision: "IF light is red, stop. ELSE IF yellow, slow down. ELSE, go." Nested if is like: "IF it's a weekday, THEN check IF it's before 9am to decide if you're late."
