

Break & Continue

Def: break exits a loop immediately; continue skips the current iteration & moves to the next one.

How to use :- `for(int i=1; i<=10; i++){`

`if(i==5) break;`

`s.o.p(i); }` // prints 1, 2, 3, 4

} // break

`for(int i=1; i<=5; i++){`

`if(i==3) continue;`

`s.o.p(i); }` // prints 1, 2, 4, 5 (skip at 3)

} continue

when to use: break when you want to stop looping entirely once a condition is met (e.g., found what you're searching for). continue when you want to skip just one specific case but keep looping.

where to use: Searching in arrays/loops, skipping invalid values, optimizing loops (stop early once answer is found).

why we need both, not just one: They solve diff problems - break = stop completely, continue = skip just this one round. Without them, you'd need complex extra conditions to achieve the same effect.

Real-life ex: break is like leaving a queue entirely once you get what you needed. continue is like skipping one person's turn in a game but staying in the game yourself.
