

Switch

Def : A switch statement checks a variable against multiple possible fixed values & executes matching code.

How to use : `int day = 3;`

```
switch(day){
```

```
· case 1 : S.O.P("Monday"); break;
```

```
case 2 : S.O.P("Tuesday"); break;
```

```
case 3 : S.O.P("Wednesday"); break;
```

```
default : S.O.P("Invalid day");
```

```
}
```

when to use : when checking one variable against many specific

fixed values (like days, menu options, grades) - cleaner than a long if-else chain.

where to use: Menu-driven programs, day/month lookups, simple category-based logic.

why use switch instead of many if-else: when you have many fixed values to check, switch is more readable & often faster than a long chain of else if statements.

Real-life ex: Like a vending machine - you press a specific button (case), & it dispenses a specific item.

Each button is a fixed, known option, just like switch cases.
